Reflection and Documentation

It is not easy for general users, or even cs major students, to directly experience Unix commands, but I think this assignment was a very useful time because it gave me the opportunity to use various useful commands. In particular, I was able to understand the internals of the system more deeply by actually using the powerful Unix commands.

The most difficult part during the work was when I tried to terminate(kill command) the top process in Part 3. I tried to kill the top process, but I was embarrassed because it did not respond immediately. However, I was able to successfully solve the problem by using the kill -9 command, recalling the 'cat -9 kill meme' that the professor mentioned in class.

Having only used Windows-based systems, this was the first time I was able to learn the basic commands and usage of Ubuntu and various Unix-based systems, so it was very good. These commands can be usefully used in system management and software development, and will be a great help in future work.
